From research to training

A new phase for the project. After completing data collection and analysis in France, Germany, Greece, Italy and Poland, involving 127 fuel retailers and 50 VET trainers and experts, inFUELencer is now entering the Curriculum development phase. The evidence gathered will provide a solid foundation for designing training that responds directly to sector transformation and to the day-to-day needs of fuel retail operators.

Training priorities. The future Curriculum will focus on the most urgent skills and knowledge areas:

- energy transition and alternative fuels,
- EV charging infrastructure management,
- station digitalisation,
- service and business model diversification,
- regulatory compliance and financial planning.

The content will be practical, modular and flexible, supported by real-life cases and tools that can be applied to business decision-making.

Preliminary insights from the European research

The initial findings show a sector that is aware of the **need for change**, but characterised by very different training background. Investment costs, regulatory uncertainty and limited planning capacity still represent significant barriers, especially for smaller and independent operators. At the same time, there is strong interest in practical training that can help turn the green transition into concrete opportunities for innovation and long-term sustainability. **The detailed results of the survey will be shared shortly through the project's communication channels.**
